TO THE ASSISTANT COMMISSIONER FOR PATENTS

Box Patent Application
Washington, D.C. 20231

Transmitted herewith for filing under 35 U.S.C. 111(a) and 37 C.F.R. 1.53(b) is a new utility patent application for invention entitled:

IMPROVED KEYBOARD SUPPORT MECHANISM

and invented by:

George Mileos, et al. and Robert King

If a **CONTINUATION APPLICATION**, check appropriate box and supply the requisite information:

☒ **Continuation** ☐ **Divisional** ☐ **Continuation-in-part (CIP)** of prior application No.: 08/995,889

Which is a:

☐ **Continuation** ☐ **Divisional** ☐ **Continuation-in-part (CIP)** of prior application No.: _____

Which is a:

☐ **Continuation** ☐ **Divisional** ☐ **Continuation-in-part (CIP)** of prior application No.: _____

Enclosed are:

Application Elements

1. ☒ Filing fee as calculated and transmitted as described below
2. ☒ Specification having 36 pages and including the following:
 - a. ☒ Descriptive Title of the Invention
 - b. ☐ Cross References to Related Applications (if applicable)
 - c. ☐ Statement Regarding Federally-sponsored Research/Development (if applicable)
 - d. ☐ Reference to Microfiche Appendix (if applicable)
 - e. ☒ Background of the Invention
 - f. ☒ Brief Summary of the Invention
 - g. ☒ Brief Description of the Drawings (if drawings filed)
 - h. ☒ Detailed Description
 - i. ☒ Claim(s) as Classified Below
 - j. ☒ Abstract of the Disclosure

Application Elements (Continued)

3. ☐ Drawing(s) (when necessary as prescribed by 35 USC 113)
- a. ☒ Formal b. ☐ Informal Number of Sheets 12
4. ☐ Oath or Declaration
- a. ☐ Newly executed (original or copy) ☐ Unexecuted
- b. ☒ Copy from a prior application (37 CFR 1.63(d)) (for continuation/divisional application only)
- c. ☒ With Power of Attorney ☐ Without Power of Attorney
- d. ☐ DELETION OF INVENTOR(S)
Signed statement attached deleting inventor(s) named in the prior application, see 37 C.F.R. 1.63(d)(2) and 1.33(b).
5. ☒ Incorporation By Reference (usable if Box 4b is checked)
The entire disclosure of the prior application, from which a copy of the oath or declaration is supplied under Box 4b, is considered as being part of the disclosure of the accompanying application and is hereby incorporated by reference therein.
6. ☐ Computer Program in Microfiche
7. ☐ Genetic Sequence Submission (if applicable, all must be included)
- a. ☐ Paper Copy
- b. ☐ Computer Readable Copy
- c. ☐ Statement Verifying Identical Paper and Computer Readable Copy

Accompanying Application Parts

8. ☐ Assignment Papers (cover sheet & documents)
9. ☐ 37 CFR 3.73(b) Statement (when there is an assignee)
10. ☐ English Translation Document (if applicable)
11. ☐ Information Disclosure Statement/PTO-1449 ☐ Copies of IDS Citations
12. ☒ Preliminary Amendment
13. ☒ Acknowledgment postcard
14. ☐ Certificate of Mailing
- ☐ First Class ☒ Express Mail (Specify Label No.): EM379968131

PRELIMINARY AMENDMENT

Sir:

Please amend the above-identified application as follows:

In the Specification

Page 7, after line 2, add the following new paragraph:

--Preferably, the distance between hole **15** in the mounting bracket **3** and pivot point **8** is greater than the distance between where third pivot rod **13** contacts shelf bracket **4** and hole **12** in shelf bracket **4**. Alternatively, the distance between hole **15** in the mounting bracket **3** and pivot points **8** is can be less than the distance between where third pivot rod **13** contacts shelf bracket **4** and hole **12** in shelf bracket **4**.--

In the Claims

Please cancel claims 6, 8, 11-14, 32, 34, 38-41, and 58-60 without prejudice.

Please amend the following claims:

--1. (Amended) An improved auxiliary shelf mechanism for vertically and horizontally positioning an auxiliary shelf, including a means for attaching the auxiliary shelf to a desk so that the auxiliary shelf may be movably positioned relative to the desk, wherein the improvement comprises:

an articulating arm mechanism comprising:

(a) a mounting bracket, the mounting bracket having a front end and a back end, [the front end being closer to the front of the desk than the back end];

(b) an upper arm having a rear end and a front end, the upper arm being pivotally connected to the mounting bracket at a first pivot point, the rear of the upper arm being defined as the end of the upper arm closest to the mounting bracket; the front end being defined as the end opposite the rear end;

(c) a shelf bracket pivotally connected to the upper arm at a second pivot point; [the front of the upper arm being defined as the end of the upper arm closest to the shelf bracket];

(d) a side arm having a front end and a rear end, the side arm being pivotally connected to the shelf bracket at a third pivot point; the side arm being further attached to the mounting bracket at a fourth pivot point; the side arm

having within it a first opening such that the side arm can be pivoted relative to the mounting bracket about the fourth pivot point and can be reciprocatingly moved relative to the fourth pivot point; the front of the side arm being defined as the end closest to the third pivot point, and the rear of the side arm being defined as the end opposite from the front;

- (e) a stopping means, the stopping means having a first side facing towards the rear of the side arm, such that when the side arm moves laterally relative to the fourth pivot point, the rear of the side arm can contact the first side of the stopping means;

wherein the side arm and the upper arm are not substantially parallel to each other.--

--9. (Amendment) The auxiliary shelf mechanism of claim 1, wherein the articulating arm mechanism further comprises a second side arm and second stopping means [has two side arms and two stopping means], wherein the rear of each side arm can contact the first side face of its corresponding stopping means.--

--15. (Amended) The auxiliary shelf mechanism of claim 1, wherein the upper arm is connected to the mounting bracket by a first pivot rod at the first pivot point, and to the shelf bracket by a second pivot rod at the second pivot point, and further wherein the side arm is connected to the shelf bracket by a third pivot rod at the third pivot point, and to the mounting bracket by a bolt at the fourth pivot point.--

16. The auxiliary shelf mechanism of claim 1, wherein the side arm may be fixed into position relative to the mounting bracket with a fixing means.

--17. (Amended) The auxiliary shelf mechanism of claim 16, wherein the side arm may be fixed into position relative to the mounting bracket [place] with a locking mechanism.--

--18. (Amended) The auxiliary shelf mechanism of claim 17, wherein the locking mechanism [means] is a locking knob.--

--19. (Amended) The auxiliary shelf mechanism of claim 1, wherein the side arm is fixed into position by means of friction between the rear end of the side arm and the first side [face] of the stopping means.--

--20. (Amended) The auxiliary shelf mechanism of claim 1, wherein the side arm is fixed into position by means of interaction between interconnecting projections on the rear end of the side arm and the first side [face] of the stopping means.--

--21. (Amended) The auxiliary shelf mechanism of claim 1, wherein [at least one] the stopping means is attached to an inside face of the mounting bracket, and further wherein the first side [face] of the [at least one] stopping means is angled outwards towards the inside face of the mounting bracket to which the stopping means is attached.--

--22. (Amended) The auxiliary shelf mechanism of claim 1, wherein the rear end of the side arm[s] and the first side [face] of the stopping means comprise complementary series of interlocking teeth.--

--23. (Amended) The auxiliary shelf mechanism of claim 5, wherein the rear end of the side arm consists of a side-arm cam pivotally connected to the rear end of the side arm, the side-arm cam having a convex face which complements the [concave face] first side of the stopping means [with which it comes in contact].--

--24. (Amended) The auxiliary shelf mechanism of claim 1, wherein the articulating arm mechanism further comprises means for rotating it relative to the desk.--

--26. (Amended) The auxiliary shelf mechanism of claim 1, wherein the articulating arm mechanism further comprises:

(a) a second side arm [there are two side arms];

(b) a second stopping means [there are two stopping means, optionally connected to one another];

and further wherein:

[(c)] (i) the first side [face] of each stopping means is concave; and

[(d)] (ii) each stopping means is attached to an inside face of the mounting

bracket, and further wherein the first face of each stopping means is angled

- outwards towards the inside face of the mounting bracket to which each stopping means is attached so that the end of each side arm can contact a stopping means and an inside face of the mounting bracket simultaneously;
- (e) the fourth pivot point is disposed beneath the first pivot point, and the third pivot point is disposed beneath the second pivot point;
- (f) the articulating arm mechanism may be rotated relative to the desk by means of a swivel mechanism attached to the mounting bracket in combination with a mounting track to which the mounting bracket is slidably connected [, either directly or indirectly].--

~~--27.~~ (Amended) An articulating arm mechanism for connecting a shelf to a desk comprising:

- (a) a mounting bracket, the mounting bracket having a front end and a back end, [the front end being closer to the front of the desk than the back end];
- (b) an upper arm having a rear end and a front end, the upper arm being pivotally connected to the mounting bracket at a first pivot point, the rear of the upper arm being defined as the end of the upper arm closest to the mounting bracket; the front end being defined as the end opposite the rear end;
- (c) a shelf bracket pivotally connected to the upper arm at a second pivot point; [the front of the upper arm being defined as the end of the upper arm closest to the shelf bracket];

(d) a side arm having a front end and a rear end, the side arm being pivotally connected to the shelf bracket at a third pivot point; the side arm being further attached to the mounting bracket at a fourth pivot point; the side arm having within it a first opening such that the side arm can be pivoted relative to the mounting bracket about the fourth pivot point and can be reciprocatingly moved relative to the fourth pivot point; the front of the side arm being defined as the end closest to the third pivot point, and the rear of the side arm being defined as the end opposite from the front;

(e) a stopping means, the stopping means having a first side facing towards the rear of the side arm, such that when the side arm moves laterally relative to the fourth pivot point, the rear of the side arm can contact the first side of the stopping means;

wherein the side arm and the upper arm are not substantially parallel to each other.--

Remarks

Applicants have filed this continuation application to pursue patent protection for the claim canceled from the parent application, and have amended the remaining claims to address the § 112 issues raised in the parent application. In addition, the specification has been amended to conform with the amendments made in parent application.

Respectfully submitted,

By: 

N. Whitney Wilson

IMPROVED KEYBOARD SUPPORT MECHANISM

Cross-Reference to Related Applications

This application is a continuation-in-part of Provisional U.S. Application
5 Serial No. 60/040,972, filed March 12, 1997 in the name of the same inventors and
bearing the same title.

Field of the Invention

This invention relates to improved adjustable support mechanisms for
10 keyboards and other items.

Background of the Invention

The use of computers for both personal and business use has become so
common that it is fair to say that almost all businesses, and many homes, have at least one
15 computer or computer terminal. Computers are particularly prevalent in the office
environment. Among the health issues which have become increasingly important as the
use of computers has become more common is the need to promote proper posture while
using the computer so as to both maintain working efficiency and minimize the
occurrence of repetitive stress injuries. One basic principal which has been developed to
20 address these issues is that the computer keyboard should be used while at a level
considerably below the level of most desktops, so the user's wrists, when the keyboard is
in use, are a "neutral" position; that is, the surface defined by the user's forearms and the

top of his or her hands is flat. In addition to regulating the height at which the keyboard is used, it is also important for ergonomic purposes to control the angle which the keyboard shelf makes with the ground.

There have been a number of devices which have been developed for use in supporting keyboards (and associated computer accessories, such as a computer mouse) at a level below the surface of a desk while in use and underneath the desk when not in use. One such device is described in Smeenge, et al., U.S. Patent No. 4,616,798, which discloses the use of a parallelogram linkage to connect a shelf for holding a keyboard to the underside of the desk surface. The overall system described by Smeenge permits a fair degree of flexibility in positioning the keyboard relative to the user and the desk. One disadvantage of Smeenge's system is that the parallelogram linkage used by the system is attached to the underside of the keyboard support shelf. Therefore, when the keyboard is positioned underneath the desk, the leg room available to the user between the bottom of the mechanism and the floor is limited.

McConnell, U.S. Patent No. 5,257,767 attempted to address this deficiency of the Smeenge mechanism by using a non-parallelogram linkage to connect the keyboard shelf to the underside of the desk. This non-parallelogram linkage causes the front of the keyboard shelf to be angled upwards when the shelf is lowered relative to the desk top, marginally increasing the leg room available to the user when the keyboard is positioned beneath the desk. Like the Smeenge mechanism, the McConnell mechanism has its linkage attached to the bottom of the keyboard shelf, which limits the total leg room available to the user.

Summary of the Invention

In one aspect, this invention improves upon the prior art mechanisms by the use of a novel linkage between the underside of the desk and the keyboard shelf, which novel linkage increases the leg room available to the user. The improved mechanism of this invention permits the adjustment of the angle of the keyboard shelf relative to the ground within certain parameters so that the angle is ergonomically correct for the vast majority of users.

The mechanism according to this aspect of the invention comprises a novel articulating arm mechanism for permitting vertical movement of the keyboard shelf. The articulating arm mechanism has six major components: (1) a mounting bracket, (2) a mounting bracket support in combination with a swivel bracket, (3) a shelf bracket, (4) an upper arm, (5) at least one side arm, and (6) at least one stopping means. The upper arm links the shelf bracket and the mounting bracket; the side arm and the stopping means cooperate to keep the shelf bracket at a constant angle relative to the ground.

A second aspect of the invention comprises the attachment of a linkage between a desk and a keyboard shelf so that nothing extends beneath the bottom of the keyboard shelf.

Brief Description of the Drawings

FIG. 1 is an exploded, perspective view of the auxiliary shelf mechanism of the invention.

FIG. 2 is a side elevational view of the auxiliary shelf mechanism in its downward and retracted position. Those parts of the mechanism which would not ordinarily be seen from this angle are shown in dotted lines; a keyboard is also shown in dotted lines, but does not form part of the invention.

5 FIG. 3 is a top plan view of an adjustable stopping means for use in the auxiliary shelf mechanism of the invention.

FIG. 4 is a side elevational view, similar to the view in FIG. 2, showing the auxiliary shelf mechanism in an extended and upward position.

FIG. 5 is a top plan view showing the auxiliary shelf mechanism as
10 attached to a desk. The dotted lines show how the auxiliary shelf mechanism may be rotated relative to the desk, which is also shown in dotted lines.

FIG. 6 is a front elevational view of the auxiliary shelf mechanism, showing the means by which the mechanism can be made to rotate as shown in FIG. 4.

FIG. 7 is a side elevational view of a portion of a different embodiment of
15 the invention, showing a movable stopping means. The dotted lines show the stopping means in a different position.

FIG. 8 is a side elevational view of the portion of the invention shown in FIG. 7, showing slightly different details of the movable stopping means.

FIG. 9 is a top view of an embodiment of the invention, showing a
20 movable stopping means.

FIG. 10 is a top view of a portion of an embodiment of the invention, showing a stopping means with a chamfer in combination with a section of the mounting bracket.

FIG. 11 shows the same view as shown in FIG. 10, with the stopping means with a chamfer and a portion of the mounting bracket, with the additional showing of the side arm.

FIG. 12 shows a side view of an alternate embodiment of the side arm in combination with the stopping means.

FIG. 13 is a bottom elevational view of a different movable stopping means.

FIG. 14 is a bottom view of the embodiment shown in FIG. 13.

FIG. 15 is a top elevational view of element of the mechanism used to allow the stopping means to move as shown in FIG. 13.

FIG. 16 is a top elevational view of a different element of the mechanism used to allow the stopping means to move as shown in FIG. 13.

FIG. 17 is a bottom elevational view of a different movable stopping means.

FIG. 18 is a bottom view of the embodiment shown in FIG. 17.

FIG. 19 is a top elevational view of an element of the mechanism used to allow the stopping means to move as shown in FIG. 17.

Detailed Description

As used in this specification and the appended claims, the term “desk” means any desk, table, shelf, or other suitable work surface. The term “desk top” means the working surface of a desk (i.e. the surface facing upwards). The term “front” when

applied to any component of the auxiliary shelf mechanism means the end closest to the user; the term "back" means the part farthest away from the user.

Referring to FIG. 1, there is illustrated an exploded view of an auxiliary shelf mechanism 1 according to the invention. Auxiliary shelf mechanism 1 includes an upper arm 2, a mounting bracket 3, a shelf bracket 4, and a pair of side arms 5. Though
5 two side arms 5 are shown in FIG. 1 and constitute the preferred embodiment, only one side arm is required. Attached to mounting bracket 3 is a mounting bracket support 6 (shown in FIG. 6) in combination with swivel bracket 32 and swivel bracket support 33. The combination of the swivel bracket 33 and the mounting bracket support is illustrated
10 in further detail in FIG. 6. A first pivot rod 7 connects mounting bracket 3 to upper arm 2 at paired pivot points 8, secured by washers 9 and push nuts 10. Upper arm 2 is attached to shelf bracket 4 by means of second pivot rod 11 through holes 12 (one such hole is not shown).

Side arms 5 are attached to shelf bracket 4 by means of third pivot rod 13.

15 The use of two side arms 5 is preferred and illustrated because this arrangement enhances stability of shelf bracket 4, but only one is necessary. Side arms 5 are attached to mounting bracket 3 by means of bolt 14, which extends through holes 15 in the mounting bracket 3 (one not shown) and through first openings 16 in the side arms. Spacer 41 is wrapped around bolt 14 and is wider than first openings 16, so as to prevent it from
20 sliding out from between side arms 5 via first openings 16. Spacer 41 provides assistance in locking the mechanism in place, as described more fully below. One end of bolt 14 is square (this end is not shown in drawing). The square end can either be part of bolt 14 as manufactured or can be a cover which is slipped onto the round end. The square end

prevents bolt 14 from rotating due to the interaction of the square end with first opening 16.

A curved end 21 of each side arm 5 projects behind first openings 16 away from shelf bracket 4. Lower arm 17 is not required, but is included in the preferred 5 embodiments shown in the drawings. Lower arm 17 is attached to upper arm 2 by means of fourth pivot rod 18 through holes 19 (one not shown) in upper arm 2. Lower arm 17 is also attached to both side arms 5 and mounting bracket 3 by means of bolt 14. Bolt 14 passes through lower arm 17 through second openings 20 (one not shown).

As shown in FIG. 2, auxiliary shelf mechanism 1 may be attached to the 10 underside of a desk top 36 by means of mounting track 22. Mounting track 22 is affixed to the underside of desk top 36 by conventional means, such as nails or screws. Swivel bracket support 33 cooperates with mounting track 22 as is more fully shown in FIG. 6 to permit auxiliary shelf mechanism 1 to slide back and forth relative to mounting track 22. Also shown in FIG. 2 is stopping means 23, which is attached to mounting bracket 3. 15 Stopping means 23 has a first side 24 which faces towards the curved end 21 of the side arm. There is one first side 24 for each side arm 5. Preferably, though not necessarily, first side 24 is concave in shape, as shown in the different figures.

In an embodiment where the stopping means is adjustable and when two side arms are used, the two first sides 24 can form part of a single stopping means, which 20 consequently has a C-shaped top profile, as shown in FIG. 3 (the first sides 24 representing the ends of the short parts of the "C" 37), with the open side of the "C" facing towards the front. The center piece 38 connecting the two sides of the stopping means 23 can have its lateral position relative to mounting bracket 3 adjusted by means of

knob 27, as described more fully below, or by any other means. When two side arms 5 are used, but stopping means 23 is not adjustable, two stopping means may be used, each of which may be attached in a fixed manner by spot-welding or flat riveting (or other conventional means) to the side of mounting bracket 3.

5 Keyboard 25 (not part of this invention) can rest directly on shelf bracket 4, as shown in the drawing. Preferably, however, an additional, wider keyboard shelf (not shown) is attached to shelf bracket 4 through attachment holes 26 (as shown in FIG. 1), on which can rest the keyboard. Additional components, such as a supplemental shelf for a computer mouse or pad of paper may be attached to the keyboard shelf (or directly
10 to shelf bracket 4).

In the preferred embodiment, upper arm 2, lower arm 17, and mounting bracket 3 thereby form a wedge-shaped box whose surfaces are made up of the top of upper arm 2, the base of lower arm 17, and the overlapping sides of upper arm 2 and lower arms 17, and whose edges are defined by first pivot rod 7, fourth pivot rod 18, and
15 bolt 14. From the side, as shown in FIG. 2, the system resembles a triangle, which can be pivoted to permit the raising or lowering of shelf bracket 4 relative to mounting bracket 3, and hence the top of the desk 36. As upper arm 2 pivots about first pivot rod 7, lower arm 17 both pivots about bolt 14 and slides forward or backward relative to it, via first and second openings 16 and 20.

20 Curved ends 21 of side arms 5 contact first sides 24 of stopping means 23. This prevents side arms 5 from sliding rearwards, relative to bolt 14, past the point where side arms 5 contact the first sides 24 of the stopping means 23. When first sides 24 have a concave shape, this point varies as side arms 5 are pivoted around bolt 14. By

positioning stopping means 23 at a specific distance behind bolt 14, and giving first sides 24 of stopping means 23 a particular degree of curvature (which may be easily determined by one of ordinary skill in the art), shelf bracket 4 can be kept at consistent angle relative to the ground, regardless of the height of shelf bracket 4 relative to mounting bracket 3.

Side arms 5 are kept in contact with the first sides 23 of stopping means 24 by means of the arrangement of shelf bracket 4, upper arm 2, and side arms 5. Upper arm 2 is pivotally connected to shelf bracket 4 by means of second pivot rod 11. Therefore, the weight of shelf bracket 4 (plus the weight of anything else attached to it or resting on it) will tend to force shelf bracket 4 to pivot around first pivot rod 11. This pivoting action forces third pivot rod 13 backwards, in turn forcing side arm 5 (attached to shelf bracket 4 by means of third pivot rod 13) back into the first sides 24 of stopping means 23. Thus, side arms 5 will always be in contact with stopping means 23, keeping shelf bracket 4 at a consistent horizontal orientation.

The relative movements of the various components of the mechanism as shelf bracket 4 is moved in a vertical direction can best be appreciated by comparing their positions as shown in FIGS. 2 and 4, which depict auxiliary shelf mechanism 1 in a retracted, downward position and in an extended, forward position respectively.

It is preferable to upwardly bias auxiliary shelf mechanism 1 slightly, by means of a torsion spring 39, or other types of springs (e.g. leaf springs) or other conventional mechanisms, such as a compressible fluid cylinder.

Stopping means 23 can be fixed in position during the manufacturing process by any conventional means. Among the means for fixing it are spot welding or

flat riveting. Fixing the stopping means in position ensures that the horizontal orientation of shelf bracket 4 remains constant.

Alternatively, the position of stopping means 23 can be adjustable. By adjusting the position of the stopping means, the angle of shelf bracket 4 relative to the ground can be changed. This is because a change in position of stopping means 23 changes the amount by which the side arms 5 can be pushed back, which in turn changes the angle of shelf bracket 4 to the ground. Preferably the position of stopping means 23 can only be adjusted within certain parameters, the limits of which ensure that the angle of shelf bracket 4 is always within an ergonomically acceptable range.

If stopping means 23 is movable, its position may be adjusted by a variety of means, such as with a sliding track with a locking mechanism, or with a rack and pinion mechanism, or with a pneumatic cylinder. One preferred means, however, is by way of a screw-type mechanism, as shown in FIGS. 7-9. Knob 27 is connected by threaded bolt 28 to stopping means 23. Threaded bolt 28 is attached to stopping means 23 by being screwed into threaded aperture 29 in stopping means 23. As knob 27 is turned in one direction, threaded bolt 28 is also turned; because stopping means 23 and threaded aperture 29 cannot also turn (because of geometric constraints within mounting bracket 3), the turning of threaded bolt 28 in one direction forces it to unscrew from threaded aperture 29, pushing stopping means 23 towards the front of mounting bracket 3. The turning of knob 27 in the other direction has the opposite effect. The degree to which threaded bolt 28 can be screwed or unscrewed from the threaded aperture 29 (and hence the degree to which stopping means 23 may be moved) may be governed by the use of mechanical stopping means as shown in FIGS. 8 and 9. FIG. 9 shows a top view of

the mechanism. As may be seen from the drawing, stop rod 42 runs parallel to center piece 38 of stopping means 23. FIG. 8 shows a side view of mounting bracket 3 with stopping means 23. Stop rod 42 is fixed in place and is vertically positioned in the middle of ends 37 of stopping means 23, running through ends 37 via third openings 43 (only one shown). As stopping means 23 moves back and forth relative to mounting bracket 3 from the turning of knob 27, third openings 43 move relative to stop rod 42. Once stop rod 42 reaches an end of third openings 43, stopping means 23 cannot move any further in that direction. The dotted lines in FIG. 7 show stopping means 23 in a forwardly displaced position compared to the position shown in the solid lines.

Other simple mechanical means may also be used to limit the amount by which stopping means 23 can be moved.

Another screw-type mechanism for adjusting the position of the stopping means is shown in FIGS. 13-16. As shown in FIG. 13, sliding bracket 46 is adjacent to mounting bracket 3. Sliding bracket 46 is shown in more detail in FIG. 15. Stopping means 23 are attached to sliding bracket 46 by conventional means, such as rivets or screws. Sliding bracket 46 has, near to where stopping means 23 are attached to it, fourth openings 53, through which passes stop rod 42, which is attached to mounting bracket 3. As was discussed above in connection with FIGS. 7 and 8, the interaction between stop rod 42 and fourth openings 53 limits the amount of possible back and forth movement by the mechanism.

Sliding bracket 46 is attached to setting bracket 47 (shown in more detail in FIG. 16) by means of attachment pin 48 which passes through opening 49 in setting bracket 47 and openings 63 in sliding bracket 46 (shown in FIG. 15). Setting bracket 49

is attached to mounting bracket 3 by means of attachment rods 50 and 51, which pass through holes 52 (see FIG. 16). Opening 49 is angled so that as setting bracket 47 is moved from side to side relative to mounting bracket 3, attachment pin 48, which must slide within the confines of opening 49 is forced to move either forward or backward, which in turn forces sliding bracket 46 and stopping means 23 to also move forward or backward.

For example, looking at FIG. 14, if setting bracket 47 is pushed to the left, it is easy to see that attachment pin 48 will be forced along opening 49 towards the front of mounting bracket 3, forcing sliding bracket 46 to also move forward, carrying stopping means 23 forward also. By varying the angle of opening 49 it is possible to control how much sideways movement of setting bracket 47 will force forward movement of sliding bracket 46.

In the embodiment shown in FIGS. 13 and 14, the lateral position of setting bracket 47 (and hence sliding bracket 46 and stopping means 23) is adjusted by means of knob 54 in combination with threaded attachment rod 50 and threaded fastener 55. Threaded fastener 55 is attached to setting bracket 46 adjacent to one of the holes 52. Threaded attachment rod 50 passes through one hole 52 and threaded fastener 55. One end of threaded attachment rod 50 is attached to knob 54 (which is positioned on the outside of mounting bracket 3), while the other is rotatably fixed to the opposite side of mounting bracket 3. When knob 54 is turned by the user, it turns threaded attachment rod 50 and causes it to interact with threaded fastener 55. Because threaded attachment rod 50 is rotatably fixed, threaded fastener 55 is forced to "migrate" up and down threaded

attachment rod 50, causing setting bracket 46 to move laterally, and the rest of the mechanism to move forwards and backwards as described above.

A related mechanism for adjusting the position of the stopping means 23 is shown in FIGS. 17-19. In this embodiment, the position of the stopping means 23 is
5 adjusted by means of sliding bracket 46 in combination with setting bracket 47a.

However, the lateral position of setting bracket 47a is not adjusted by means of threaded screw mechanism as described above, but rather by means of adjustment lever 56.

Setting bracket 47a differs from setting bracket 47 in that it includes a laterally protruding wing 59, which has within it a hole 60. Position bracket 57 is fixedly attached
10 to mounting bracket 3. Adjustment lever 56 is pivotally attached to position bracket 57 by pin 58. Adjustment lever 56 is attached to setting bracket 47a by means of pin 61 which passes through hole 60 in setting bracket 47a and through slot 62 in adjustment lever 56.

When the handle 63 of adjustment lever 56 is moved by the user,
15 adjustment lever 56 pivots around pin 58. This in turn forces movement of slot 62 relative to mounting bracket 3. Because of the attachment of setting bracket 47a to adjustment lever 56 by means of pin 61 through slot 62, movement of slot 62 forces lateral movement of setting bracket 47a along attachment rods 51. As discussed above, this in turn provides forward and backwards movement of stopping means 23.

20 Depending upon the exact mechanism used to adjust the stopping means, such adjustment can be easier or more difficult for the user. For example, if the stopping means can only be adjusted using a screwdriver (instead of by the mechanisms described above) it will less convenient to adjust. This arrangement may be desirable for some

applications, where it is sought to minimize the number of adjustments which can be made by the immediate user.

The primary purpose behind adjusting the stopping means is to adjust the angle of keyboard shelf 4 relative to the ground. The farther forward stopping means 23 is positioned, the greater the elevation of the front of shelf bracket 4, and vice-versa. An alternative means for adjusting the horizontal orientation of shelf bracket 4 which is particularly useful when stopping means 23 is not adjustable is by means of conventional locking knob 31, as shown in FIG. 1. Bolt 14 is screwed into locking knob 31. When locking knob 31 is turned, bolt 14 is prevented from also turning by the interaction of its square end with lateral opening 16. The threaded connection between locking knob 31 and bolt 14 forces locking knob 31 to move in towards spacer 41, forcing side arm 5 and lower arm 17 into closer contact with spacer 41. This eventually tightens the system to the point where neither rotation or lateral movement of lower arm 17 or side arm 5 about bolt 14 is possible. To facilitate the "squeezing" of lower arm 17, its rearward sections around and adjacent to openings 20 do not have a bottom section connecting them, unlike at the its forward sections around and adjacent to fourth pivot rod 18.

When locking knob 31 is used, the angle of shelf bracket 4 can be adjusted by tilting the front of shelf bracket 4 up, pulling side arm 5 away from stopping means 23 and locking shelf bracket 4 into this position by tightening locking knob 31. By "locking" side arm 5 at a position where it is pulled away from stopping means 23, the angle of shelf bracket 4 can be altered from what would permitted by the use of stopping means 23. The use of locking knob 31 is preferred when only one side arm 5 and one

stopping means 23 are used, and when stopping means 23 cannot be moved. Locking knob 31 can also be used in conjunction with a movable stopping means.

Other similar, known friction-based systems, such as stopping means with handles, can be used in place of locking knob 31.

5 The height at which shelf bracket 4 is maintained during use or storage relative to desktop 36 is controlled by the interaction of side arms 5 and stopping means 23. Each side arm 5 contacts the first side 24 of stopping means 23, stopping the rearward motion of the side arms 5 and keeping the shelf bracket 4 at a constant angle relative to the ground. By tilting the front of shelf bracket 4 up, each side arm 5 is pulled
10 away from its respective stopping means 23, permitting vertical movement of the auxiliary shelf mechanism 1. When the front of shelf bracket 4 is released, each side arm 5 once again contacts its respective stopping means 23. The curved end 21 of each side arm 5 does not slide relative to its respective stopping means 23 because of friction. Placing additional weight on shelf bracket 4 simply causes the curved ends 21 of the side
15 arms 5 to “dig” into each stopping means 23 even more, further inhibiting vertical movement of auxiliary shelf mechanism 1.

This friction based impediment to movement is enhanced by the use of a preferred configuration of stopping means 23. In this preferred embodiment, first face 24 of stopping means 23 is concave and has a 45° chamfer directed towards the outside of
20 the mechanism (i.e. towards the mounting bracket). (One of skill in the art will readily appreciate that the angle of the chamfer can be varied.) This is shown in more detail in FIG. 10. This chamfer “funnels” the side arm into a corner created by the stopping means and the mounting bracket, as shown in FIG. 11. The increased amount of friction

resulting from this arrangement results in greater vertical stability for auxiliary shelf mechanism 1.

An alternative means for improving the vertical stability of auxiliary shelf mechanism 1 involves providing curved ends 21 of side arms 5 with a series of "teeth"

5 which can cooperate with a complementary series of "teeth" on the first side 24 of stopping means 23. The interaction of the teeth on curved end 21 and the first side 24 can prevent vertical movement of auxiliary shelf mechanism 1. A further alternative, shown in FIG. 12 is to attach a pivoted side-arm cam 45 to curved end 21 of side arm 5 by means of pin 44. The curvature of pivoted side-arm cam 45 complements that of first
10 side 24, thus maximizing the contact area between the surfaces and the amount of friction between them, resulting in greater vertical stability for auxiliary shelf mechanism 1.

Any of the foregoing methods for vertically stabilizing auxiliary shelf mechanism 1 may be used in combination with any of the others (e.g. teeth may be placed on pivoted side-arm cam 45, and curved face 24 of stopping means 23).

15 Regardless of what system (if any), is used to stabilize the vertical positioning of auxiliary shelf mechanism 1, the use of the stopping means/side arm mechanism permits the user to adjust the height of the keyboard in a facile, intuitive manner, without the need to reach awkwardly around the keyboard and fumble for levers or knobs. Moreover, this system is also mechanically quite simple, does not require the
20 complex locking mechanisms of prior art devices, and presents a significant improvement over those devices.

FIG. 6 shows the means by which lateral movement of auxiliary shelf mechanism 1 is achieved. Mounting track 22 is attached to the underside of desktop 36,

normally so that it is perpendicular to the front edge of desktop 36. The outside edges of mounting track 22 are configured so as to form a pair of inwardly facing, C-shaped brackets 34. Swivel bracket 32 is shaped so that it will fit into the C-shaped brackets 34. Swivel bracket 32 (and the rest of auxiliary shelf mechanism 1) can be moved by simply pushing the mechanism back and forth along the track. Unwanted lateral movement of auxiliary shelf mechanism 1 is controlled by friction between swivel bracket 32 and C-shaped brackets 34. Moreover, when weight is placed on shelf bracket 4 (for example when a keyboard and/or a pair of hands is resting on it), this will have a tendency to cause swivel bracket 32 to tilt forward, causing the rear of swivel bracket 32 to contact the top of C-shaped brackets 34, increasing the friction-based resistance of auxiliary shelf mechanism 1 to lateral movement. If desired, an additional locking mechanism may be provided to prevent lateral movement, but such a mechanism is generally unnecessary and makes adjustment of the position of auxiliary shelf mechanism 1 more cumbersome. Mechanical stops (not shown) may be employed at either end of C-shaped brackets 34 to ensure that auxiliary shelf mechanism 1 does not slide off mounting track 22 and fall to the floor.

As an alternative to C-shaped brackets 34, downward facing T-shaped tracks may be used in conjunction with compatible structures on the mounting bracket, such as is set forth in U.S. Patent No. 4,644,875. Other known means for mounting auxiliary shelf mechanism 1 to the underside of the desk can also be used.

Swivel bracket 32 is attached to swivel bracket assembly 33, mounting bracket 3, and mounting bracket support 6 by means of a rivet (not shown). A large washer 35 is fitted between swivel bracket 32 and mounting bracket 3. The washer may

be made of any number of hard and slippery materials, including metals, but is preferably made of a hard plastic such as polyethylene, and most preferably made of nylon.

Mounting bracket support 6 is attached to the inside of mounting bracket 3. Generally, that attachment will be fixed (for example by spot welding or flat rivets). Therefore,

5 when lateral force is exerted against auxiliary shelf mechanism 1, mounting bracket 3 will tend to rotate around the rivet relative to swivel bracket 32, which is prevented from rotating by the C-shaped brackets 34 of mounting track 22. Thus, auxiliary shelf mechanism 1 can be rotated relative to the mounting track 22 and the desk top, as shown in FIG. 4. The rotational mechanism described herein is known in the art, and other
10 known mechanisms may also be used.

The materials used in the construction of auxiliary shelf mechanism 1 can be varied, but will be a stiff material for most components, preferably steel or another metal or metal alloy. In a preferred embodiment, curved ends 21 of side arms 5 and first sides 24 of stopping means 23 will have surfaces which are rough enough so as to limit
15 their ability to slide past one another, locking the system in place as described above and enhancing its vertical stability.

Another advantage of the present invention is that the shelf bracket is the part of the auxiliary shelf mechanism 1 which is closest to the ground. Nothing projects below shelf bracket 4 as in other prior art mechanisms, such as is shown in U.S. Patent
20 Nos. 5,257,767 and 4,616,798, described above. Thus, when the keyboard is pushed beneath the desk, the amount of leg room is maximized. This is achieved by attaching the various arms connecting mounting bracket 3 to shelf bracket 4 to the top and side of shelf bracket 4.

The present inventors have found that by equipping the shelf bracket with an upwardly extending piece to permit attachment of link means, the vertical profile of the overall mechanism can be shortened, increasing the leg room available to the user when the keyboard is positioned beneath the desk. Thus, another aspect of the present invention is the attachment of an auxiliary shelf (or keyboard shelf) to a desk top, so that the auxiliary shelf can move both horizontally and vertically relative to the desk top, the attachment being made so that nothing extends below the bottom of the auxiliary shelf. This arrangement maximizes the amount of leg room beneath the auxiliary shelf. The attachment between the auxiliary shelf and the desk can be made by either a parallelogram linkage, or by a non-parallelogram linkage, or by a linkage of the type described in detail in this application (i.e. upper arm-side arm-stopping means).

One means by which this type of attachment may be accomplished is by using an auxiliary shelf with a vertically oriented piece attached to its rear side. The linkage can be attached to this vertically oriented piece, precluding the need for anything to project beneath the auxiliary shelf. For example, shelf bracket 4 is shaped in such a way that a more conventional parallelogram linkage or non-parallelogram linkage could be used, instead of the upper arm-side arm-stopping means system shown specifically in the drawings. Other attachment means may also be used, as will be readily apparent to those of skill in this area.

We claim:

1. An improved auxiliary shelf mechanism for vertically and horizontally positioning an auxiliary shelf, including a means for attaching the auxiliary shelf to a desk so that the auxiliary shelf may be movably positioned relative to the desk, wherein
5 the improvement comprises:

an articulating arm mechanism comprising:

- (a) a mounting bracket, the mounting bracket having a front end and a back end,
the front end being closer to the front of the desk than the back end;
- (b) an upper arm pivotally connected to the mounting bracket at a first pivot point,
10 the rear of the upper arm being defined as the end of the upper arm closest to the mounting bracket;
- (c) a shelf bracket pivotally connected to the upper arm at a second pivot point;
the front of the upper arm being defined as the end of the upper arm closest to the shelf bracket;
- 15 (d) a side arm pivotally connected to the shelf bracket at a third pivot point; the side arm being further attached to the mounting bracket at a fourth pivot point;
the side arm having within it a first opening such that the side arm can be pivoted relative to the mounting bracket about the fourth pivot point and can be reciprocatingly moved relative to the fourth pivot point; the front of the
20 side arm being defined as the end closest to the third pivot point, and the rear of the side arm being defined as the end opposite from the front;
- (e) a stopping means, the stopping means having a first side facing towards the rear of the side arm, such that when the side arm moves laterally relative to the

fourth pivot point, the rear of the side arm can contact the first side of the
stopping means;

wherein the side arm and the upper arm are not substantially parallel to each other.

5 2. The auxiliary shelf mechanism of claim 1, wherein the third pivot point is
disposed beneath the second pivot point.

3. The auxiliary shelf mechanism of claim 1, wherein the fourth pivot point is
disposed beneath the first pivot point.

10

4. The auxiliary shelf mechanism of claim 1, wherein the fourth pivot point is
disposed beneath the first pivot point, and the third pivot point is disposed beneath the
second pivot point.

15 5. The auxiliary shelf mechanism of claim 1, wherein the first side of the stopping
means is concave.

6. The auxiliary shelf mechanism of claim 1, wherein the first and fourth pivot
points are closer together than the second and third pivot points.

20

7. The auxiliary shelf mechanism of claim 1, wherein the fourth pivot point is
disposed beneath the first pivot point, and the third pivot point is disposed beneath the
second pivot point, and the first side of the stopping means is concave.

8. The auxiliary shelf mechanism of claim 1, wherein the articulating arm mechanism further comprises a lower arm, the lower arm being pivotally attached to the upper arm at a fifth pivot point, the fifth pivot point being disposed between the first and second pivot points, the lower arm being further attached to the mounting bracket at the fourth pivot point, the lower arm further having within it a second opening, such that the lower arm can pivot about the fourth pivot point and can be reciprocatingly moved relative to the fourth pivot point.

9. The auxiliary shelf mechanism of claim 1, wherein the articulating arm mechanism has two side arms and two stopping means, wherein the rear of each side arm can contact the first face of its corresponding stopping means.

10. The auxiliary shelf mechanism of claim 9, wherein the two stopping means are connected to each other.

11. The auxiliary shelf mechanism of claim 1, wherein the position of the stopping means is adjustable between a first position and a second position, the first position being closer to the front end of the mounting bracket than the second position, and the second position being closer to the back end of the mounting bracket than the first position.

12. The auxiliary shelf mechanism of claim 11, wherein the position of the stopping means can be fixed at either the first position, or the second position, or at any position between the first and second positions.

5 13. The auxiliary shelf mechanism of claim 6, wherein the position of the stopping means is adjusted by means of a threaded screw mechanism.

14. The auxiliary shelf mechanism of claim 1, wherein the position of the stopping means is adjusted by means of a lever mechanism, the lever mechanism comprising an
10 adjustment lever, a setting bracket, and a sliding bracket.

15 15. The auxiliary shelf mechanism of claim 1, wherein the upper arm is connected to the mounting bracket by a first pivot rod and to the shelf bracket by a second pivot rod, and further wherein the side arm is connected to the shelf bracket by a third pivot rod and to the mounting bracket by a bolt.

16. The auxiliary shelf mechanism of claim 1, wherein the side arm may be fixed into position relative to the mounting bracket with a fixing means.

20 17. The auxiliary shelf mechanism of claim 16, wherein the side arm may be fixed into place with a locking mechanism.

18. The auxiliary shelf mechanism of claim 17, wherein the locking means is a locking knob.

19. The auxiliary shelf mechanism of claim 1, wherein the side arm is fixed into position by means of friction between the end of the side arm and the first face of the stopping means.

20. The auxiliary shelf mechanism of claim 1, wherein the side arm is fixed into position by means of interaction between interconnecting projections on the end of the side arm and the first face of the stopping means.

21. The auxiliary shelf mechanism of claim 1, wherein at least one stopping means is attached to an inside face of the mounting bracket, and further wherein the first face of at least one stopping means is angled outwards towards the inside face of the mounting bracket to which the stopping means is attached.

22. The auxiliary shelf mechanism of claim 1, wherein the rear end of the side arms and the first face of the stopping means comprise complementary series of interlocking teeth.

23. The auxiliary shelf mechanism of claim 5, wherein the rear end of the side arm consists of a side-arm cam pivotally connected to the end of the side arm, the side-arm

cam having a convex face which complements the concave face of the stopping means with which it comes in contact.

24. The auxiliary shelf mechanism of claim 1, wherein the articulating arm
5 mechanism comprises means for rotating it relative to the desk.

25. The auxiliary shelf mechanism of claim 24, wherein the means for rotating the
articulating arm mechanism relative to the desk comprises a swivel mechanism attached
to the mounting bracket in combination with a mounting track to which the mounting
10 bracket is slidably connected, either directly or indirectly.

26. The auxiliary shelf mechanism of claim 1, wherein:
(a) there are two side arms;
(b) there are two stopping means, optionally connected to one another;
15 (c) the first face of each stopping means is concave;
(d) each stopping means is attached to an inside face of the mounting bracket, and
further wherein the first face of each stopping means is angled outwards
towards the inside face of the mounting bracket to which each stopping means
is attached so that the end of each side arm can contact a stopping means and
20 an inside face of the mounting bracket simultaneously;
(e) the fourth pivot point is disposed beneath the first pivot point, and the third
pivot point is disposed beneath the second pivot point;

(f) the articulating arm mechanism may be rotated relative to the desk by means of a swivel mechanism attached to the mounting bracket in combination with a mounting track to which the mounting bracket is slidably connected, either directly or indirectly.

5

27.

An articulating arm mechanism for connecting a shelf to a desk comprising:

- (a) a mounting bracket, the mounting bracket having a front end and a back end, the front end being closer to the front of the desk than the back end;
- (b) an upper arm pivotally connected to the mounting bracket at a first pivot point, the rear of the upper arm being defined as the end of the upper arm closest to the mounting bracket;
- (c) a shelf bracket pivotally connected to the upper arm at a second pivot point; the front of the upper arm being defined as the end of the upper arm closest to the shelf bracket;
- (d) a side arm pivotally connected to the shelf bracket at a third pivot point; the side arm being further attached to the mounting bracket at a fourth pivot point; the side arm having within it a first opening such that the side arm can be pivoted relative to the mounting bracket about the fourth pivot point and can be reciprocatingly moved relative to the fourth pivot point; the front of the side arm being defined as the end closest to the third pivot point, and the rear of the side arm being defined as the end opposite from the front;

10

15

20

(e) a stopping means, the stopping means having a first side facing towards the rear of the side arm, such that when the side arm moves laterally relative to the fourth pivot point, the rear of the side arm can contact the first side of the stopping means;

5 wherein the side arm and the upper arm are not parallel to each other.

28. The articulating arm mechanism of claim 27, wherein the third pivot point is disposed beneath the second pivot point.

10 29. The articulating arm mechanism of claim 27, wherein the fourth pivot point is disposed beneath the first pivot point.

30. The articulating arm mechanism of claim 27, wherein the fourth pivot point is disposed beneath the first pivot point, and the third pivot point is disposed
15 beneath the second pivot point.

31. The articulating arm mechanism of claim 27, wherein the first side of the stopping means is concave.

20 32. The articulating arm mechanism of claim 27, wherein the first and fourth pivot points are closer together than the second and third pivot points.

33. The articulating arm mechanism of claim 27, wherein the fourth pivot point is disposed beneath the first pivot point, and the third pivot point is disposed beneath the second pivot point, and the first side of the stopping means is concave.

5 34. The articulating arm mechanism of claim 27, wherein the articulating arm mechanism further comprises a lower arm, the lower arm being pivotally attached to the upper arm at a fifth pivot point, the fifth pivot point being disposed between the first and second pivot points, the lower arm being further attached to the mounting bracket at the fourth pivot point, the lower arm further having within it a second opening, such that the
10 lower arm can pivot about the fourth pivot point and can be reciprocatingly moved relative to the fourth pivot point.

35. The articulating arm mechanism of claim 27, wherein the articulating arm mechanism has two side arms and two stopping means, wherein the rear of each side arm
15 can contact the first face of its corresponding stopping means.

36. The articulating arm mechanism of claim 35, wherein the two stopping means are connected to each other.

20 37. The articulating arm mechanism of claim 36, wherein at least one of the first sides of each stopping means is concave.

38. The articulating arm mechanism of claim 27, wherein the stopping means is movable between a first position and a second position, the first position being closer to the front end of the mounting bracket than the back position, and the second position being closer to the back end of the mounting bracket than the first position.

5

39. The articulating arm mechanism of claim 38, wherein the position of the stopping means can be fixed at either the first position, or the second position, or at any position between the first and second positions.

10 40. The articulating arm mechanism of claim 39, wherein the position of the stopping means is adjusted by means of a threaded screw mechanism.

41. The articulating arm mechanism of claim 39, wherein the position of the stopping means is adjusted by means of a lever mechanism, the lever mechanism
15 comprising an adjustment lever, a setting bracket, and a sliding bracket.

42. The articulating arm mechanism of claim 27, wherein the upper arm is connected to the mounting bracket by a first pivot rod and to the shelf bracket by a second pivot rod, and further wherein the side arm is connected to the shelf bracket by a
20 third pivot rod and to the mounting bracket by a bolt.

43. The articulating arm mechanism of claim 27, wherein the side arm may be fixed into position relative to the mounting bracket with a fixing means.

44. The articulating arm mechanism of claim 43, wherein the side arm may be fixed into position with a locking means.

45. The articulating arm mechanism of claim 44, wherein the locking means is a locking knob.

46. The articulating arm mechanism of claim 27, wherein the side arm is fixed into position by means of friction between the end of the side arm and the first face of stopping means.

47. The articulating arm mechanism of claim 27, wherein the side arm is fixed into position by means of interaction between interconnecting projections on the end of the side arm and the first face of the stopping means.

48. The articulating arm mechanism of claim 27, wherein at least one stopping means is attached to an inside face of the mounting bracket, and further wherein the concave face of at least one stopping means is angled outwards towards the inside face of the mounting bracket to which the stopping means is attached.

49. The articulating arm mechanism of claim 27, wherein the rear end of the side arm and the concave face of the stopping means comprise complementary series of interlocking teeth.

50. The articulating arm mechanism of claim 31, wherein the rear end of the side arm consists of a side-arm cam pivotally connected to the end of the side arm, the side-arm cam having a convex face which complements the first face of the stopping means with which it comes in contact.

51. The articulating arm mechanism of claim 27, wherein the articulating arm mechanism further comprises a means for rotating it relative to the desk.

52. The articulating arm mechanism of claim 51, wherein the means for rotating it relative to the desk comprises a swivel mechanism attached to the mounting bracket.

53. The articulating arm mechanism of claim 27, wherein:

- (a) there are two side arms;
- (b) there are two stopping means, optionally connected to one another;
- (c) the first face of each stopping means is concave;
- (d) each stopping means is attached to an inside face of the mounting bracket, and further wherein the first face of each stopping means is angled outward towards the inside face of the mounting bracket to which each stopping means is attached so that the end of each side arm can contact a stopping means and the inside face of the mounting bracket simultaneously

(e) the fourth pivot point is disposed beneath the first pivot point, and
the third pivot point is disposed beneath the second pivot point;
and

(f) the articulating arm mechanism may be rotated relative to the desk
by means of a swivel mechanism attached to the mounting bracket
in combination with a mounting track to which the mounting
bracket is slidably connected, either directly or indirectly.

10

54.

An articulating arm mechanism for connecting a shelf to a desk

comprising:

- (a) a mounting bracket, the mounting bracket having a front end and a back end,
the front end being closer to the front of the desk than the back end;
- (b) an upper arm pivotally connected to the mounting bracket at a first pivot point,
the rear of the upper arm being defined as the end of the upper arm closest to
the mounting bracket;
- (c) a shelf bracket pivotally connected to the upper arm at a second pivot point;
the front of the upper arm being defined as the end of the upper arm closest to
the shelf bracket;
- (d) a side arm pivotally connected to the shelf bracket at a third pivot point; the
side arm being further attached to the mounting bracket at a fourth pivot point;
the side arm having within it a first opening such that the side arm can be
pivoted relative to the mounting bracket about the fourth pivot point and can

15

20

be reciprocatingly moved relative to the fourth pivot point; the front of the side arm being defined as the end closest to the third pivot point, and the rear of the side arm being defined as the end opposite from the front;

(e) a stopping means, the stopping means having a first side facing towards the rear of the side arm, such that when the side arm moves horizontally relative to the fourth pivot point, the rear of the side arm can contact the first side of the stopping means;

wherein the side arm and the upper arm are substantially not parallel to each other; and further wherein the position of the stopping means relative to the side arm and the shape of the first side of the stopping means are such that regardless of the angle of the side arm to the ground, the angle of the shelf bracket relative to horizontal remains constant.

55. An improved auxiliary shelf mechanism including an auxiliary shelf having a top surface and a bottom surface, and a linkage to attach the auxiliary shelf to a desk so that the auxiliary shelf may be moved horizontally and/or vertically relative to the desk, wherein the improvement comprises attaching the linkage to the auxiliary shelf so that no part of the auxiliary shelf mechanism extends below the bottom surface of the auxiliary shelf.

56. The auxiliary shelf mechanism of claim 55, wherein the linkage is a parallelogram linkage.

57. The auxiliary shelf mechanism of claim 55, wherein the linkage is a non-parallelogram linkage.

5 58. An improved auxiliary shelf mechanism for vertically and horizontally positioning an auxiliary shelf, including a means for attaching the auxiliary shelf to a desk so that the auxiliary shelf may be moved horizontally relative to the desk, wherein the improvement comprises:

an articulating arm mechanism comprising:

- 10 (a) a mounting bracket, the mounting bracket having a front end and a back end, the front end being closer to the front of the desk than the back end;
- (b) an upper arm pivotally connected to the mounting bracket at a first pivot point, the rear of the upper arm being defined as the end of the upper arm closest to the mounting bracket;
- 15 (c) a shelf bracket pivotally connected to the upper arm at a second pivot point; the front of the upper arm being defined as the end of the upper arm closest to the shelf bracket;
- (d) a side arm pivotally connected to the shelf bracket at a third pivot point; the third pivot point being disposed beneath the second pivot point; the side arm
- 20 being further attached to the mounting bracket at a fourth pivot point, the fourth pivot point being disposed beneath the first pivot point; the side arm having within it a first opening such that the side arm can be pivoted relative to the mounting bracket about the fourth pivot point and can be

reciprocatingly moved relative to the fourth pivot point; the front of the side arm being defined as the end closest to the third pivot point, and the rear of the side arm being defined as the end opposite from the front;

(e) a stopping means, the stopping means having a first side with a concave shape facing towards the rear of the side arm, such that when the side arm moves laterally relative to the fourth pivot point, the rear of the side arm can contact the concave first side of the stopping means;

wherein the stopping means is movable between a first position and a second position, the first position being closer to the front end of the mounting bracket than the second position, and the second position being closer to the back end of the mounting bracket than the first position.

59. The auxiliary shelf mechanism of claim 58, wherein the position of the stopping means can be fixed at either the first position, or the second position, or at any position between the first and second positions.

60. The auxiliary shelf mechanism of claim 59, wherein the position of the stopping means is adjusted by means of a threaded screw mechanism.

ABSTRACT

A keyboard support mechanism containing a novel articulating arm mechanism for permitting vertical movement of the keyboard shelf. The articulating arm mechanism has six major components: (1) a mounting bracket, (2) a mounting bracket support in combination with a swivel bracket, (3) a shelf bracket, (4) an upper arm, (5) at least one side arm, and (6) at least one stopping means. The upper arm links the shelf bracket and the mounting bracket; the side arm and the stopping means cooperate to keep the shelf bracket (and hence the keyboard shelf) at a constant angle relative to the ground.

DECLARATION AND POWER OF ATTORNEY
FOR UTILITY PATENT APPLICATION - JOINT

As the below named inventors, we hereby declare that:

Our residences, post office addresses, and citizenships are as stated below next to our names.

We believe that we are the original, first, and joint inventors of the subject matter which is claimed and for which a patent is sought on the invention entitled **IMPROVED KEYBOARD SUPPORT MECHANISM** the specification of which is attached hereto.

We hereby state that we reviewed and understand the contents of the above-identified specification, including the claims, as amended by any amendment referred to above.

We acknowledge the duty to disclose information that is material to the examination of this application in accordance with 37 Code of Federal Regulations § 1.56.

We hereby claim priority benefits under 35 United States Code § 119(e) of the provisional application listed below:

Provisional Applications: U.S. Serial No. 60/040,972.

We hereby appoint the following attorneys to prosecute this application and to transact all business in the Patent and Trademark Office connected therewith:

Maurice B. Stiefel, Reg. No. 18,479; Marc S. Gross, Reg. No. 19,614; Lawrence G. Kurland, Reg. No. 24,895; Stephen P. Gilbert, Reg. No. 27,893; Mark E. Waddell, Reg. No. 31,803; David A. Roodman, Reg. No. 35,663; David M. Klein, Reg. No. 35,221; N. Whitney Wilson, Reg. No. 38,661, Daniel A. Crowe, Reg. No. 39,644, and Timothy E. Tracy, Reg. No. 39,401.

Address all telephone calls to Whitney Wilson at telephone number (202) 508-6112.

Address all correspondence to:

N. Whitney Wilson, Esq.
BRYAN CAVE LLP
245 Park Avenue
New York, New York 10167-0034

We hereby declare that all statements made herein of our own knowledge are true and that all statements made on information and belief are believed to be true; and further that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under Section 1001 of Title 18 of the United States Code and that such willful false statements may jeopardize the validity of the application or any patent issued thereon.
